

Docker for Java Developers

Fabiane Nardon, @fabianenardon Arun Gupta, @arungupta

Fabiane's introduction

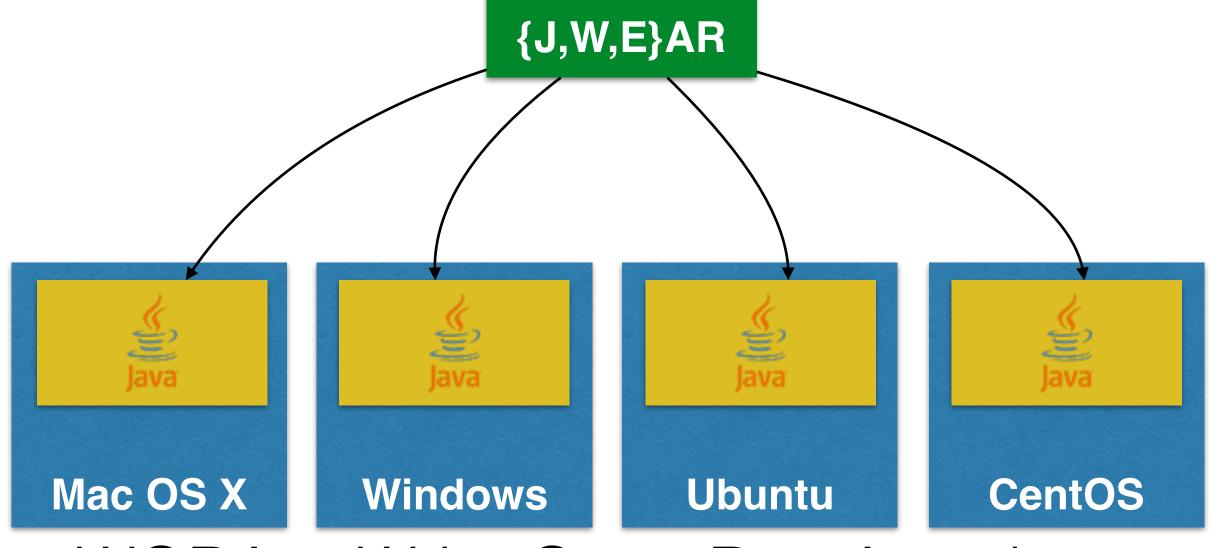

Docker Captain Java Champion JavaOne Rock Star (4 years) NetBeans Dream Team Silicon Valley JUG Leader Author Runner Lifelong learner

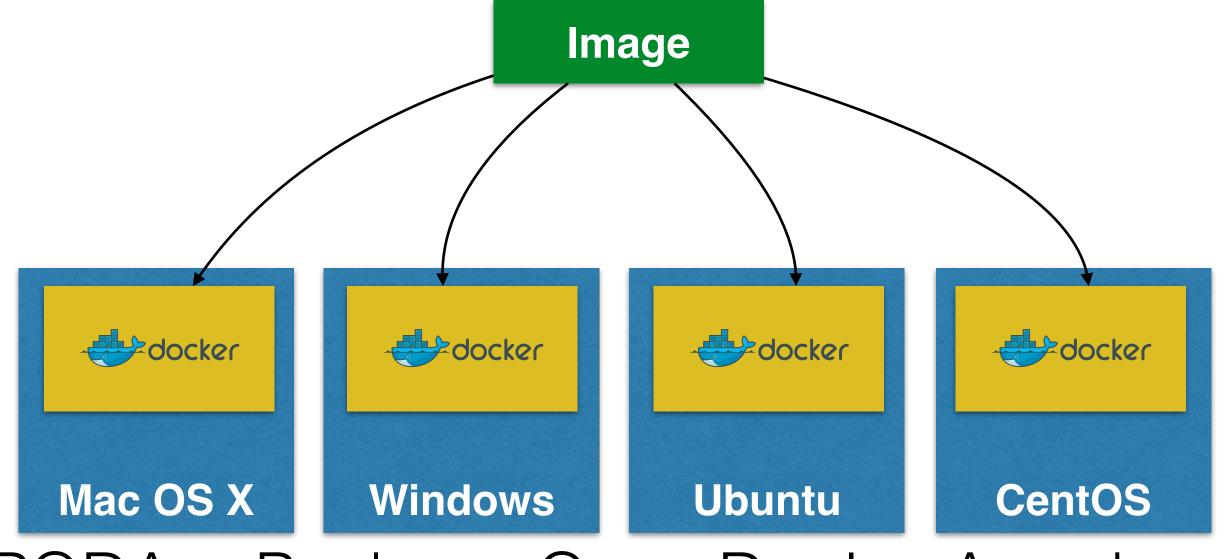

What we plan to cover?

- Java Base Image
- Package Java application with Maven or Gradle
- •Multi-container application on single/multiple host(s)
- Multi-container application using Docker for AWS
- Monitor Java application
- Deployment pipeline

Java Base Image

WORA = Write Once Run Anywhere

PODA = Package Once Deploy Anywhere

https://hub.docker.com/_/java/

Java base image #1

OFFICIAL REPOSITORY

Last pushed: 17 days ago

Repo Info

Tags

Short Description

Java is a concurrent, class-based, and object-oriented programming language.

Full Description

DEPRECATED

This image, and will receive no further updates after 2016-12-31 (Dec 31, 2016). Please adjust your usage accordingly.

java is now available in the Docker Store, the new place to discover public Dock

The image has been OpenJDK-specific since it was first introduced, and as of 2016-08-10 we also have an ibmjava image, which made it even more clear that each repository should represent one upstream instead of one language stack or community, so this rename reflects that clarity appropriately.

	Debian	Alpine
jdk	244MB	71MB
jre	124MB	56MB

Q zulu

PUBLIC | AUTOMATED BUILD

azul/zulu-openjdk ☆

Last pushed: 2 months ago

Repo Info Tags Dockerfile Build Details

Short Description

Zulu is a fully tested, compatibility verified, and trusted binary distribution of the OpenJDK.

Full Description

Zulu is a widely available binary distribution of OpenJDK. Zulu distributions are fully tested a verified builds of the latest versions of the OpenJDK 8, 7, and 6 platforms. Zulu is available full Linux, Windows, and MacOS platforms, with commercial support available upon request.

Zulu is built, tested, supported and made available by Azul Systems.

www.azul.com/zulu

First Java Docker Image

```
FROM openjdk:jdk-alpine
```

CMD java -version

First Java Web App Docker Image

```
FROM jboss/wildfly:10.1.0.Final
```

COPY target/webapp.war /opt/jboss/wildfly/standalone/deployments/webapp.war

Package Java Application using Maven or Gradle

Docker Support in Java IDEs

Multi-Container Application using Docker Compose

- Define and run multi-container applications
- Configuration defined in one or more files
 - docker-compose.yml (default)
 - docker-compose.override.yml (default)
 - Multiple files specified using -f
- Single command to manage all services
- Great for dev, staging, and CI

Multiple Files - Image and Ports

docker-compose.db.yml

```
version: '3'
services:
  web:
   ports:
    -(80:8080)
  db:
   image: couchbase:prod)
   ports:
     - 8091:8091
```

Run

```
docker-compose \
-f docker-compose.yml \
-f docker-compose.db.yml \
up -d
```

Services

```
docker-compose \
  -f docker-compose.yml \
  -f docker-compose.db.yml \
  ps
```

Shutdown

```
docker-compose \
  -f docker-compose.yml \
  -f docker-compose.db.yml \
  down
```

Service Discovery with Docker

```
version: "3"
     services:
       db:
         image: arungupta/couchbase:travel
         ports:
           - 8091:8091
           - 8092:8092
           - 8093:8093
           - 11210:11210
       web:
         image: arungupta/wildfly-couchbase-javaee:travel
         environment:
          - COUCHBASE_URI=db
13
14
         ports:
15
           - 8080:8080
           - 9990:9990
```

docker stack deploy --compose-file=docker-compose.yml webapp

Docker 1.13 - Compose v3

- docker stack deploy now supports Compose file
 - Number of desired instances of each service
 - Rolling update
 - Server constraints

Docker Compose Common Use Cases

Use Case	Command
Dev Setup	docker-compose up
Local/remote host	DOCKER_HOST, DOCKER_TLS_VERIFY,
	DOCKER_CERT_PATH
Single/multiple hosts	Integrated with Swarm
Multiple isolated environments	docker-compose up -p <pre>project></pre>
Automated test setup	docker-compose up
	mvn test
	docker-compose down
Dev/Prod Impedance mismatch	docker-compose up -f docker-compose.yml -f
	production.yml

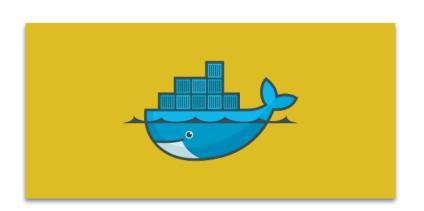

Multi-Container Application on Multi-Host using Swarm-mode

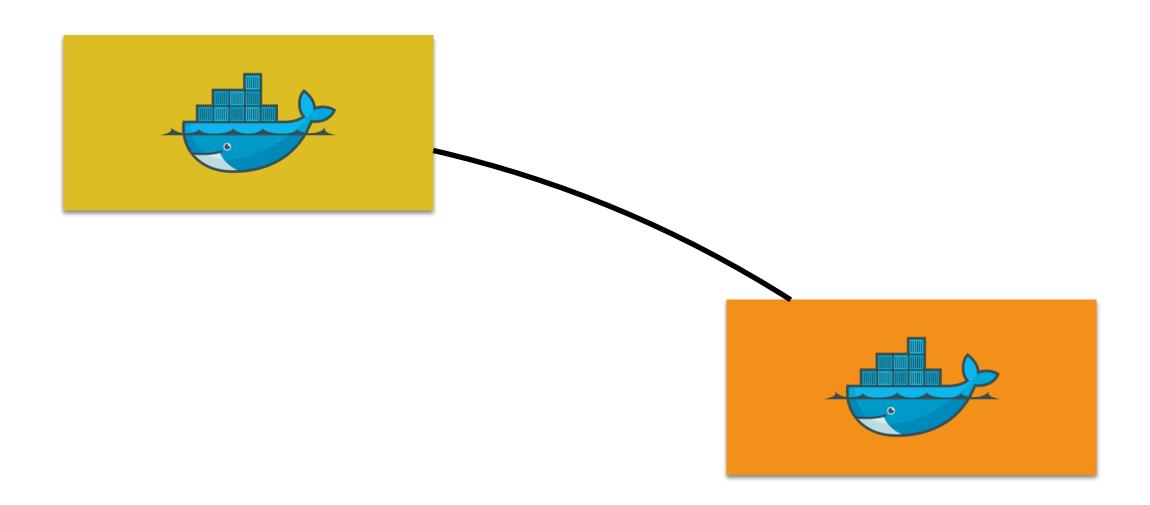

Swarm Mode

- Natively managing a cluster of Docker Engines called a Swarm
- Docker CLI to create a swarm, deploy apps, and manage swarm
 - Optional feature, need to be explicitly enabled
- No Single Point of Failure (SPOF)
- Declarative state model
- Self-organizing, self-healing
- Service discovery, load balancing and scaling
- Rolling updates

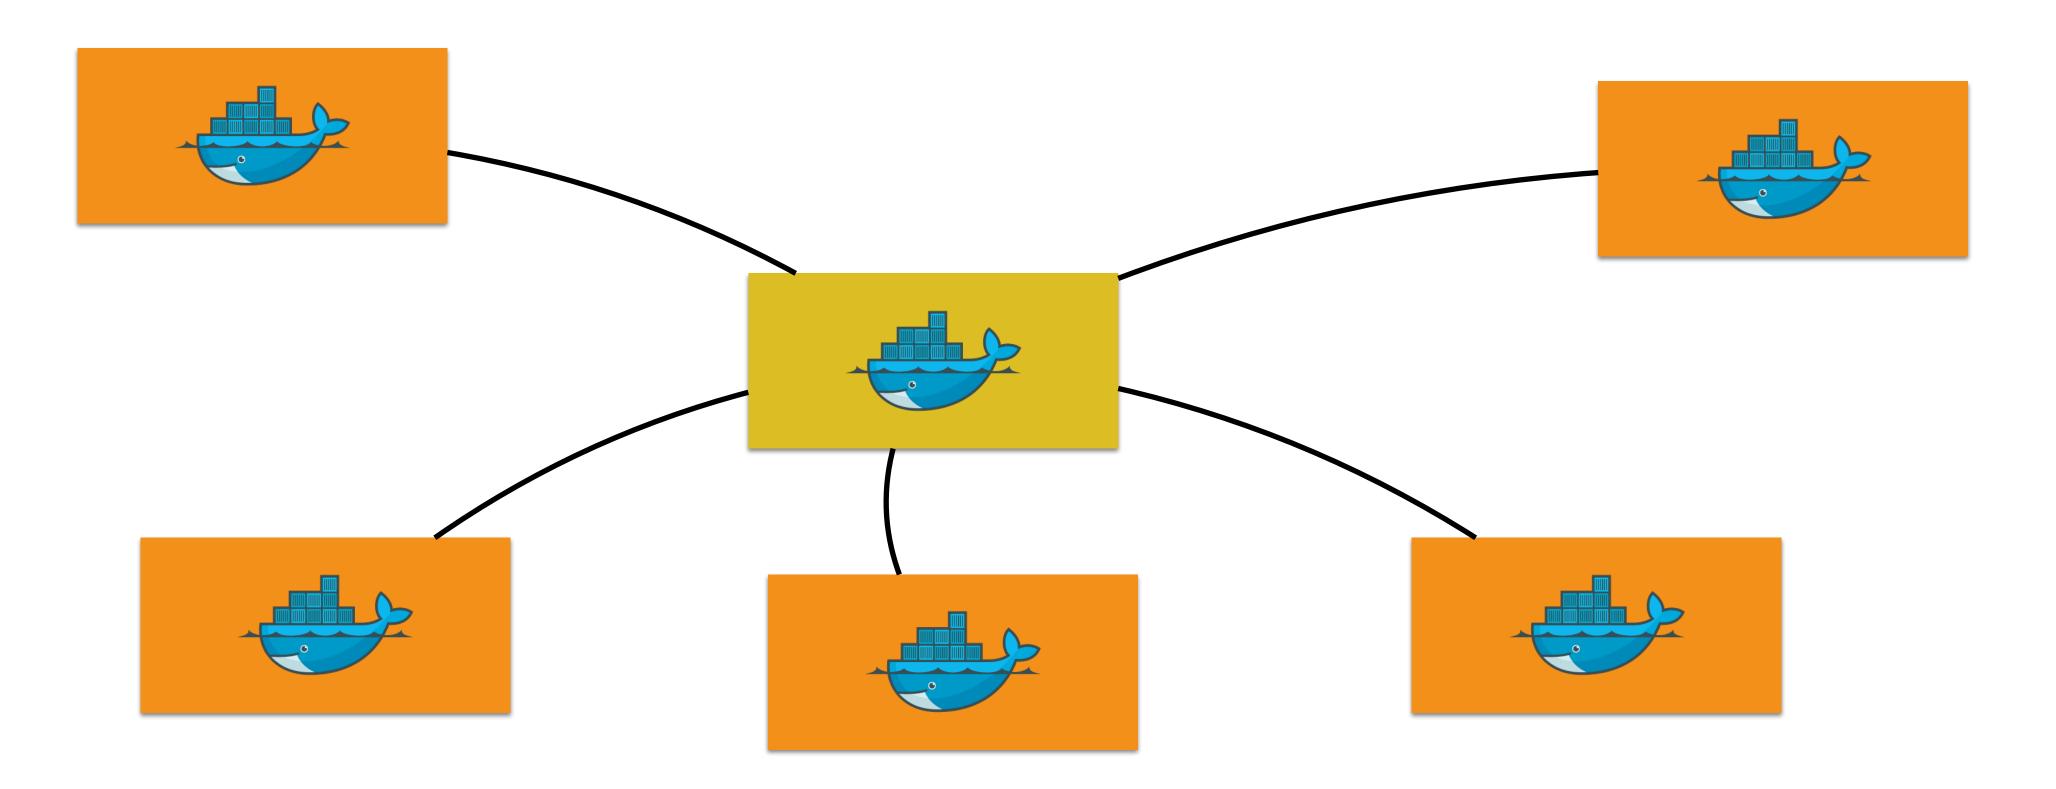

Swarm Mode: Initialize

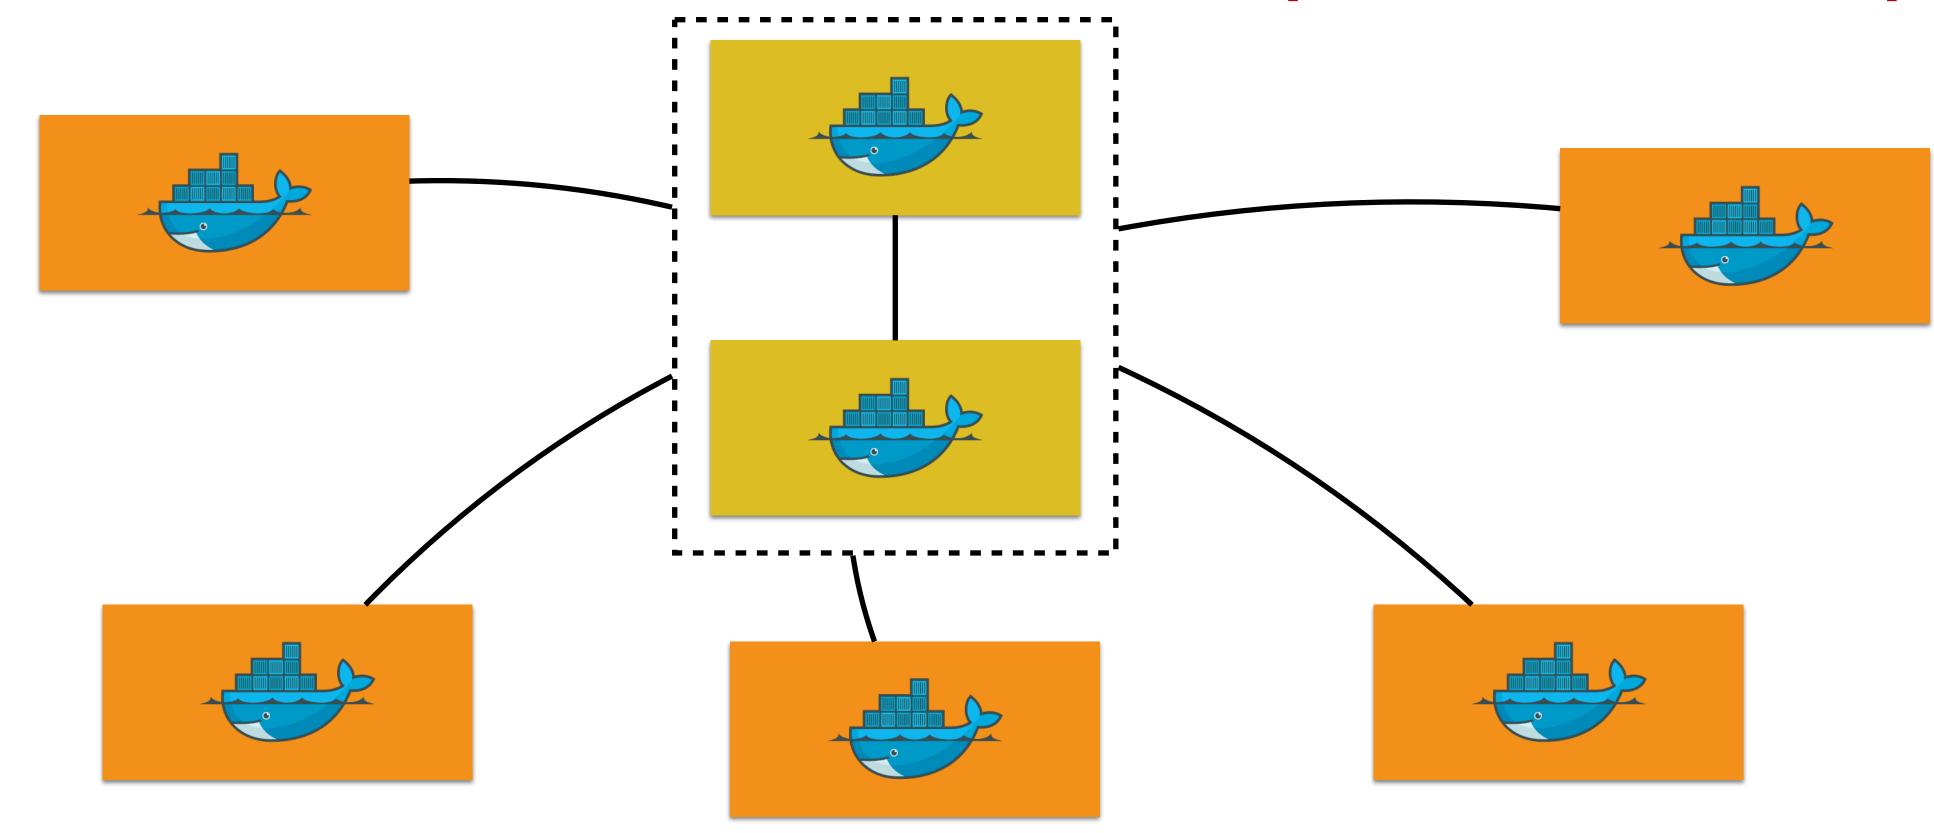

Swarm Mode: Add Worker

Swarm Mode: Add More Workers

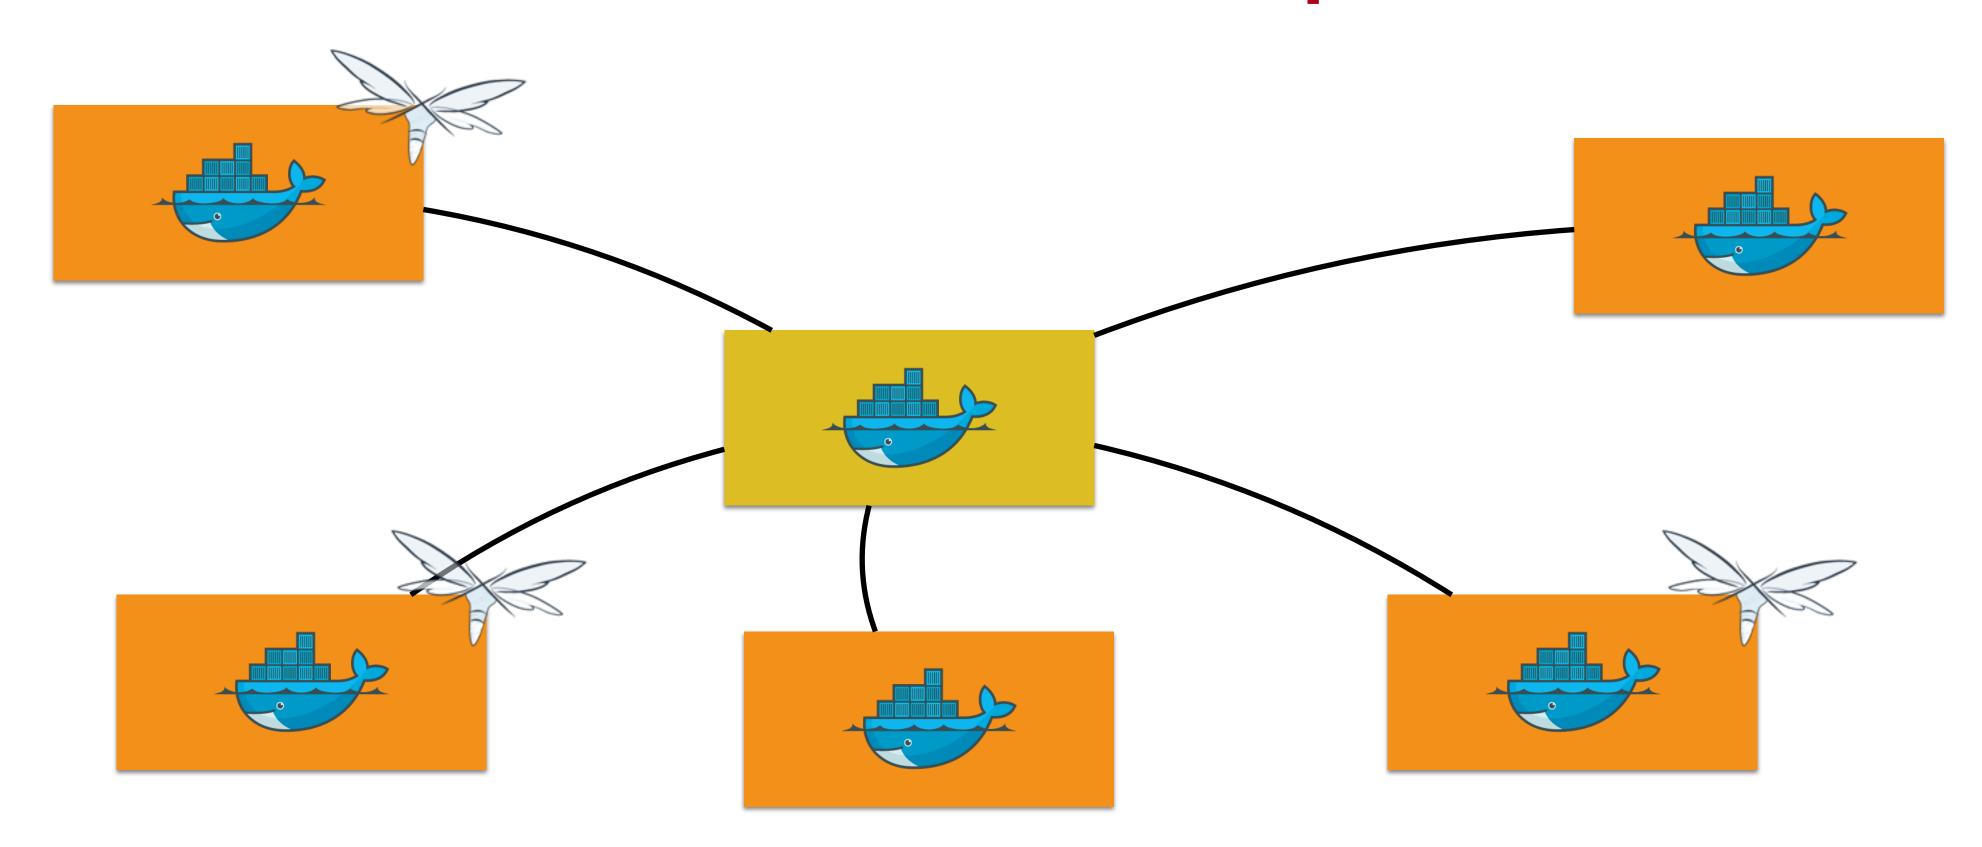

Swarm Mode: Primary/Secondary Master

docker swarm join --manager --token <manager_token> --listen-addr <master2>:2377 <master1>:2377

Swarm Mode: Replicated Service

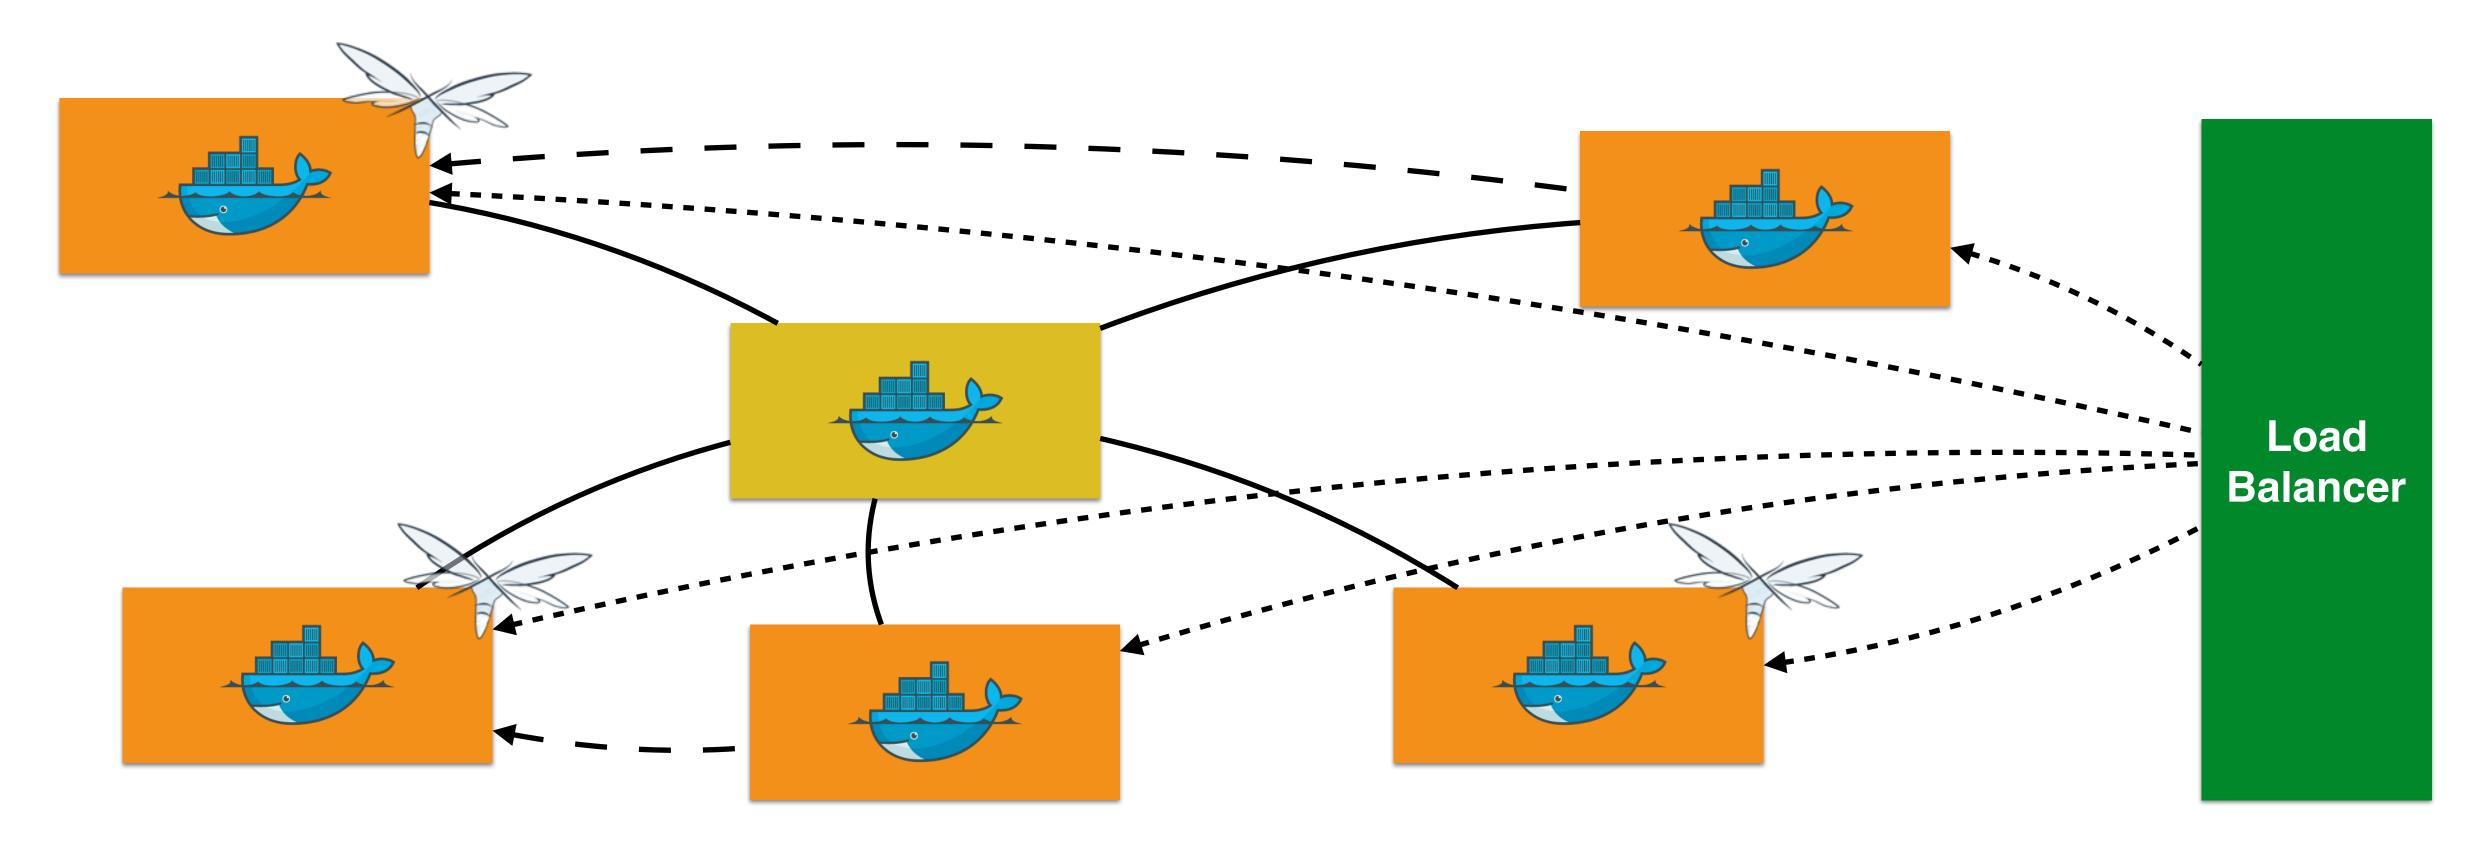

docker service create --replicas 3 --name web jboss/wildfly

Swarm Mode - Routing Mesh

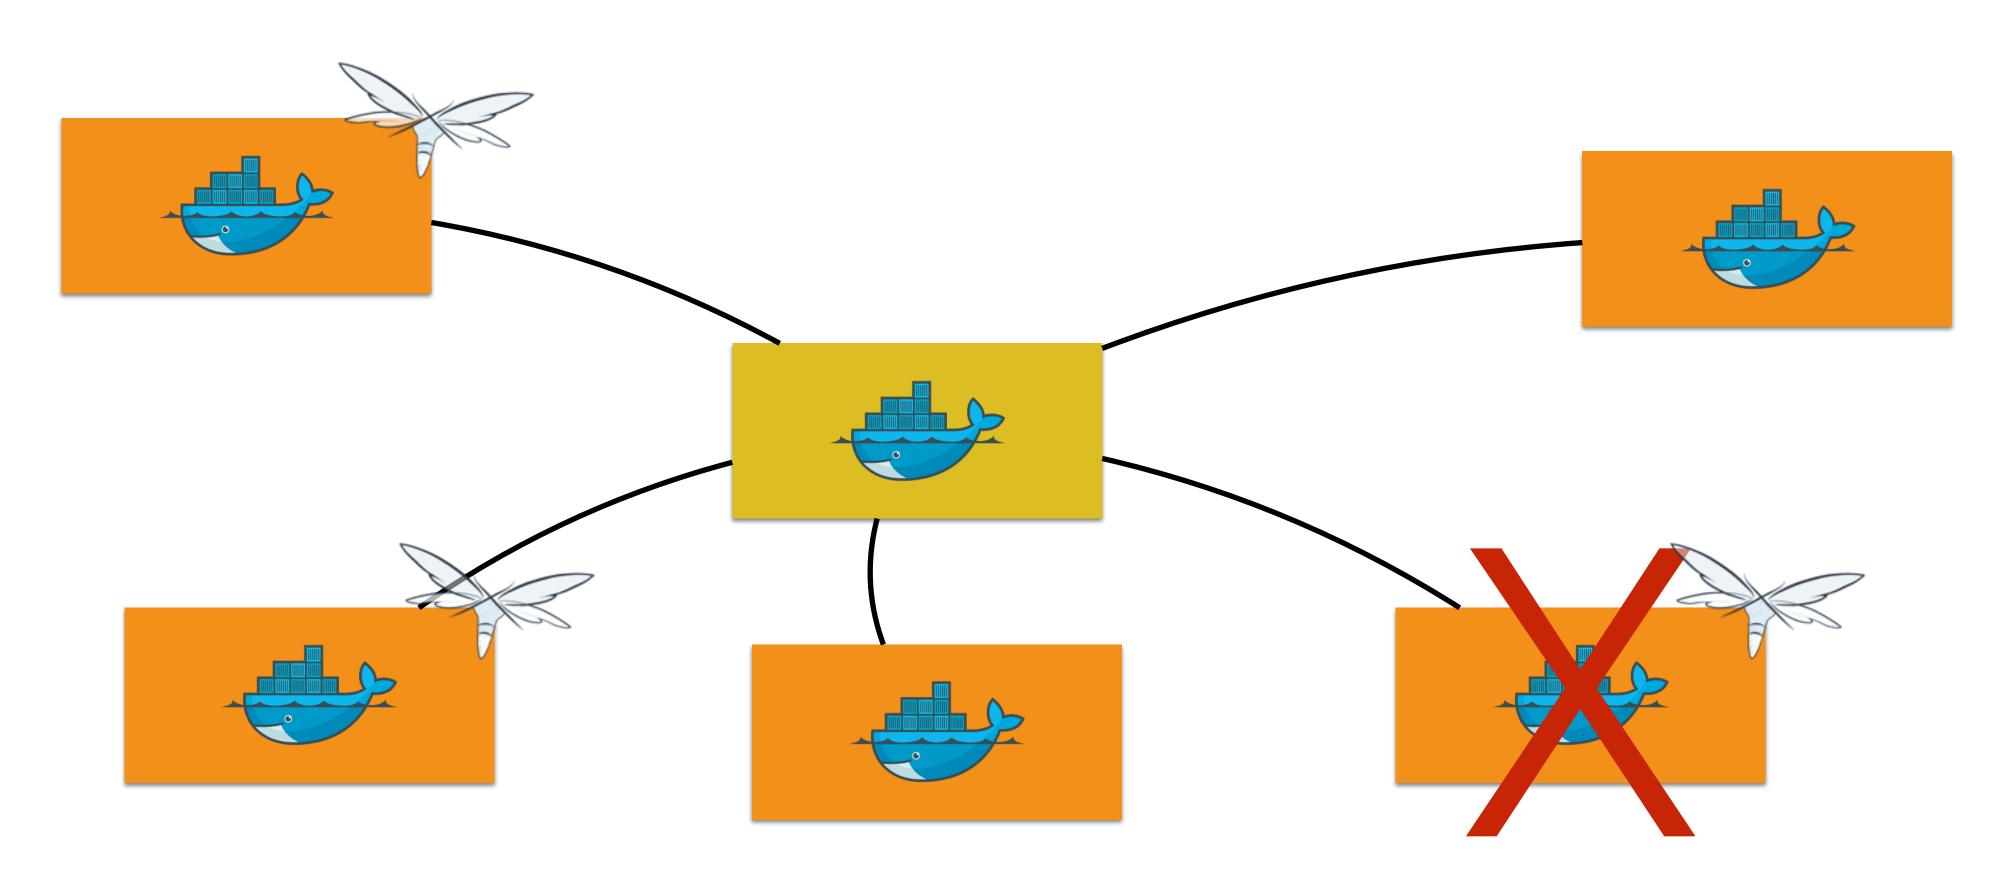

- Load balancers are host-aware, not container-aware
- Swarm mode introduces container-aware routing mesh
- Reroutes traffic from any host to a container
 - Reserves a Swarm-wide ingress port
 - Uses DNS-based service discovery

Swarm Mode: Routing Mesh

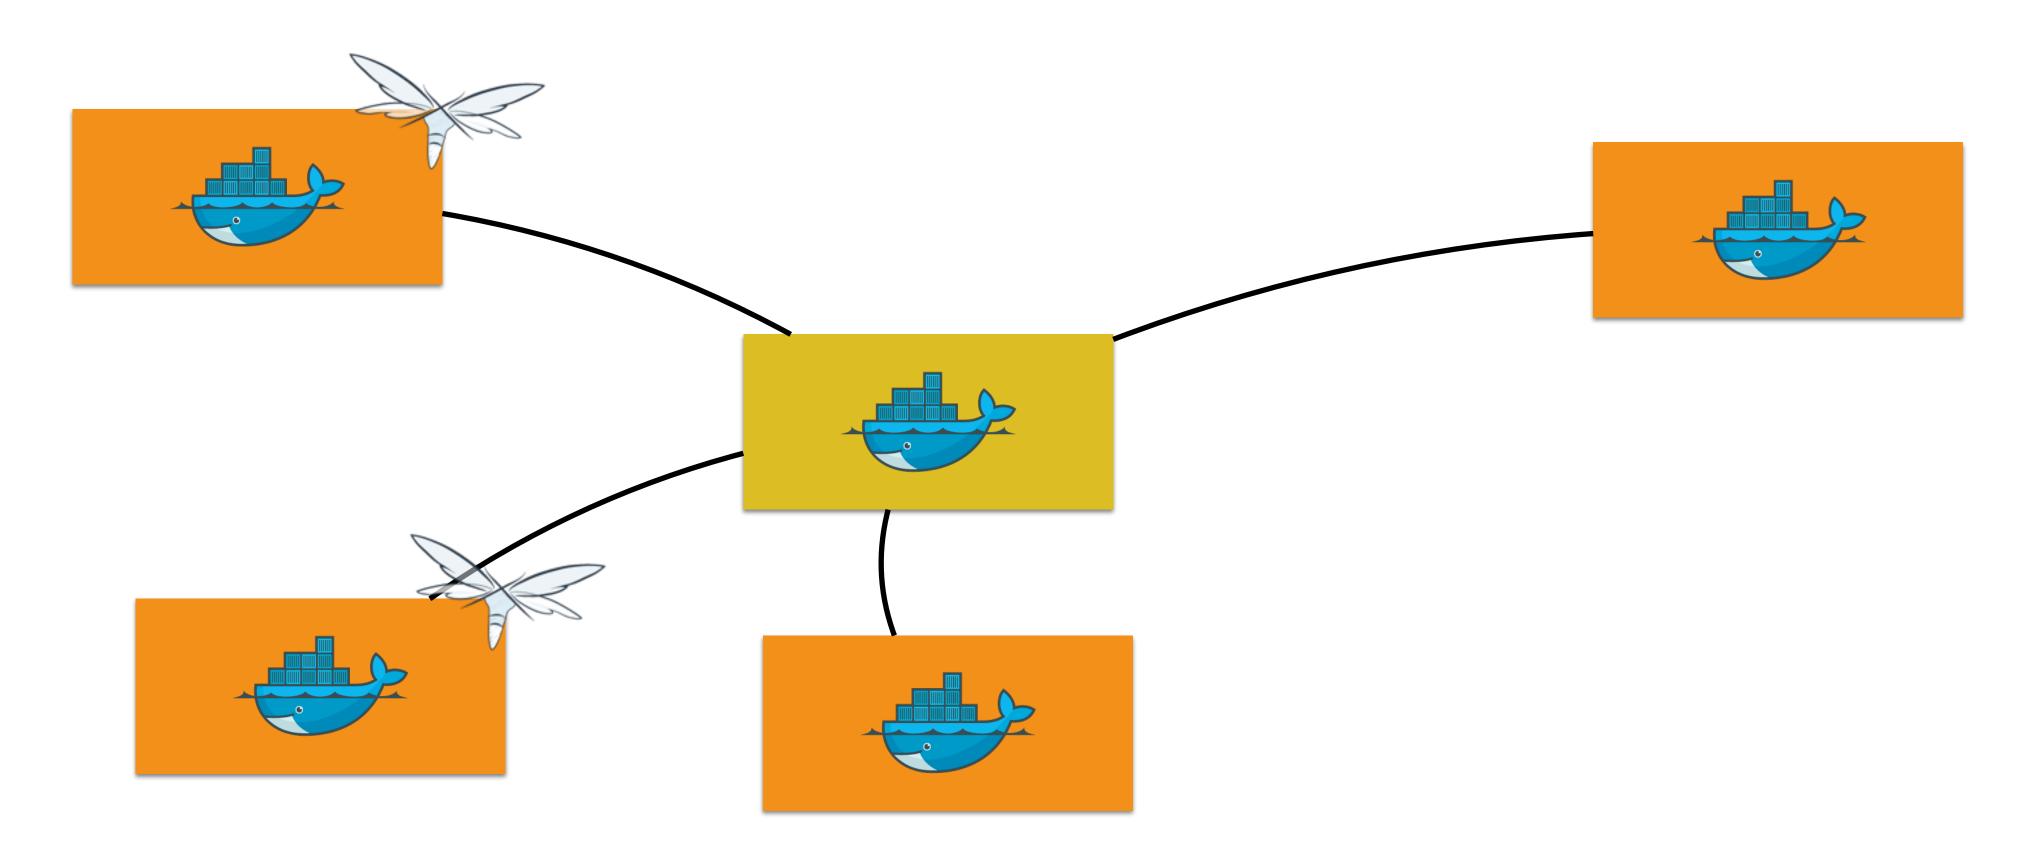

docker service create --replicas 3 --name web -p 8080:8080 jboss/wildfly

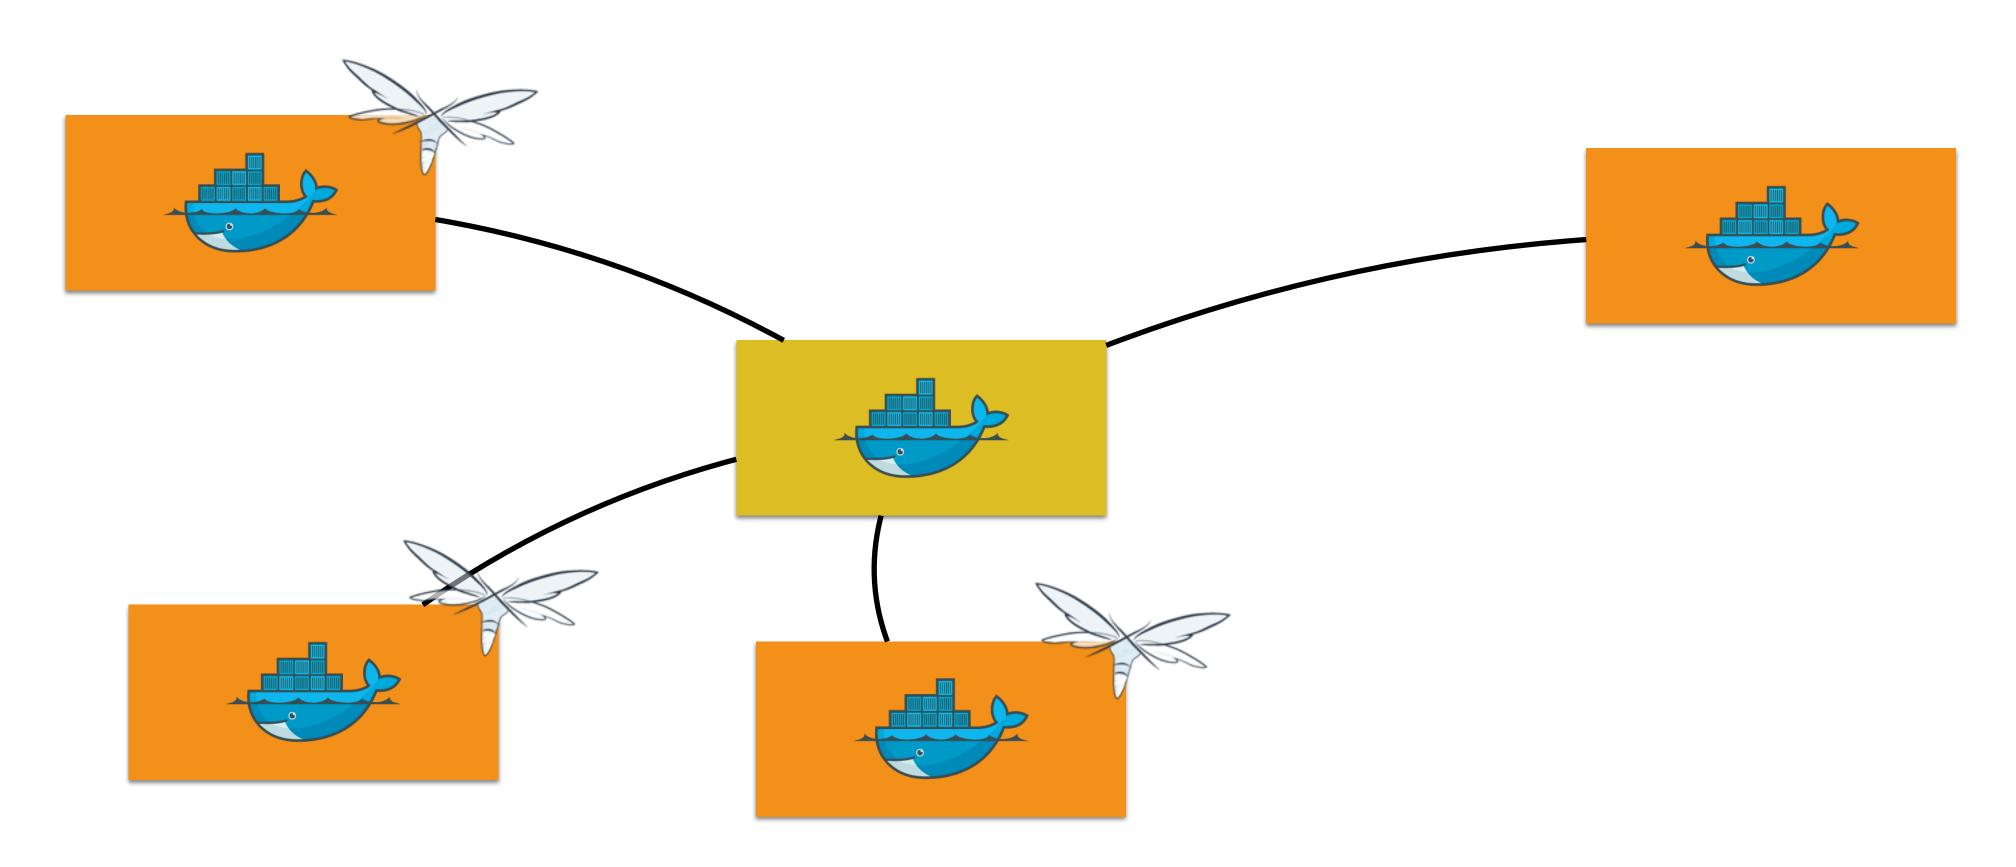

Swarm Mode: Node Failure

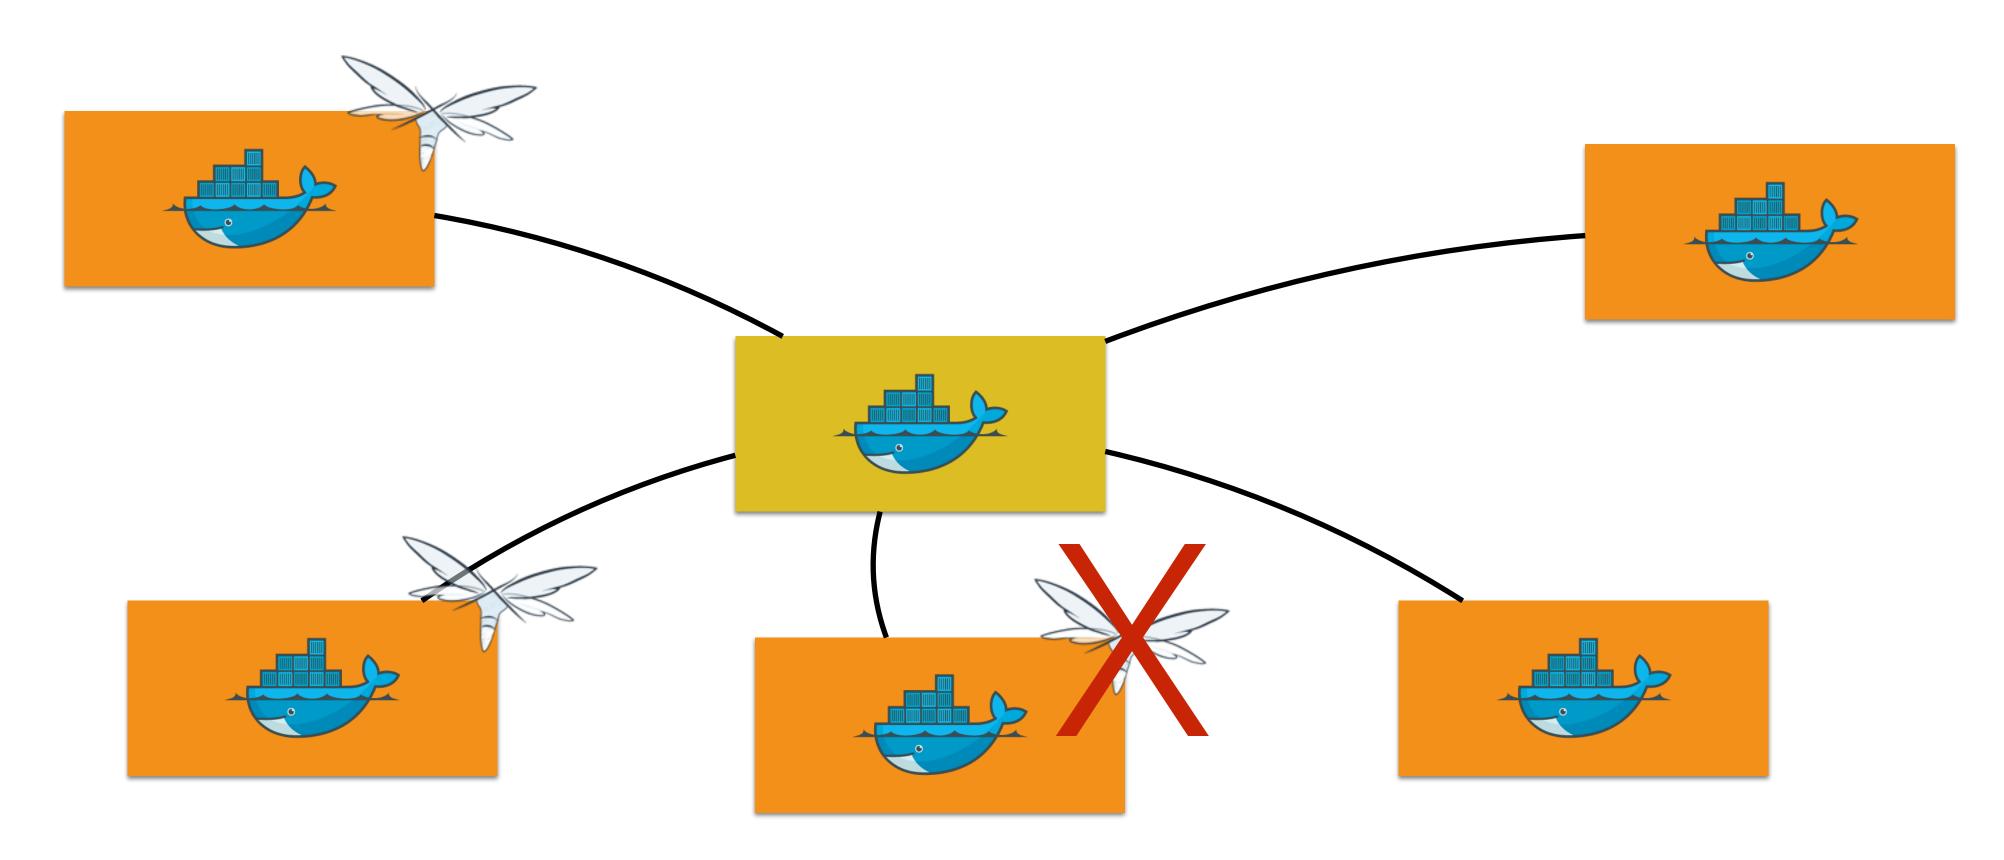

Swarm Mode: Desired!= Actual

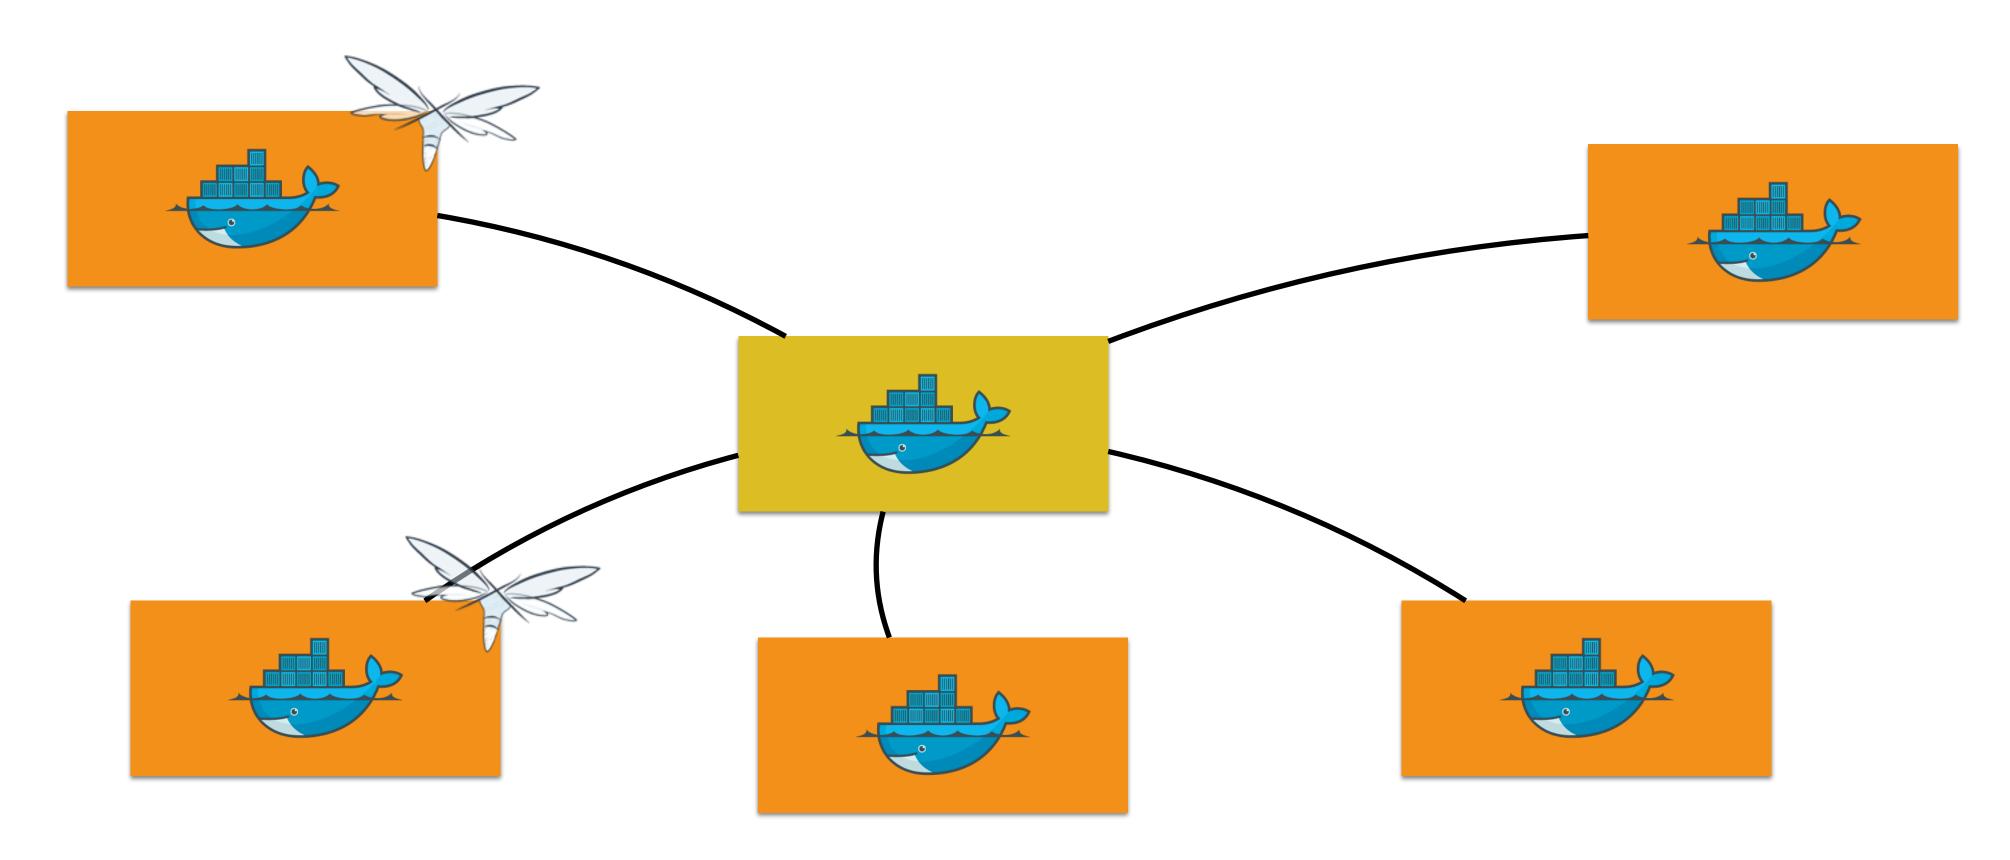

Swarm Mode: Reconcile

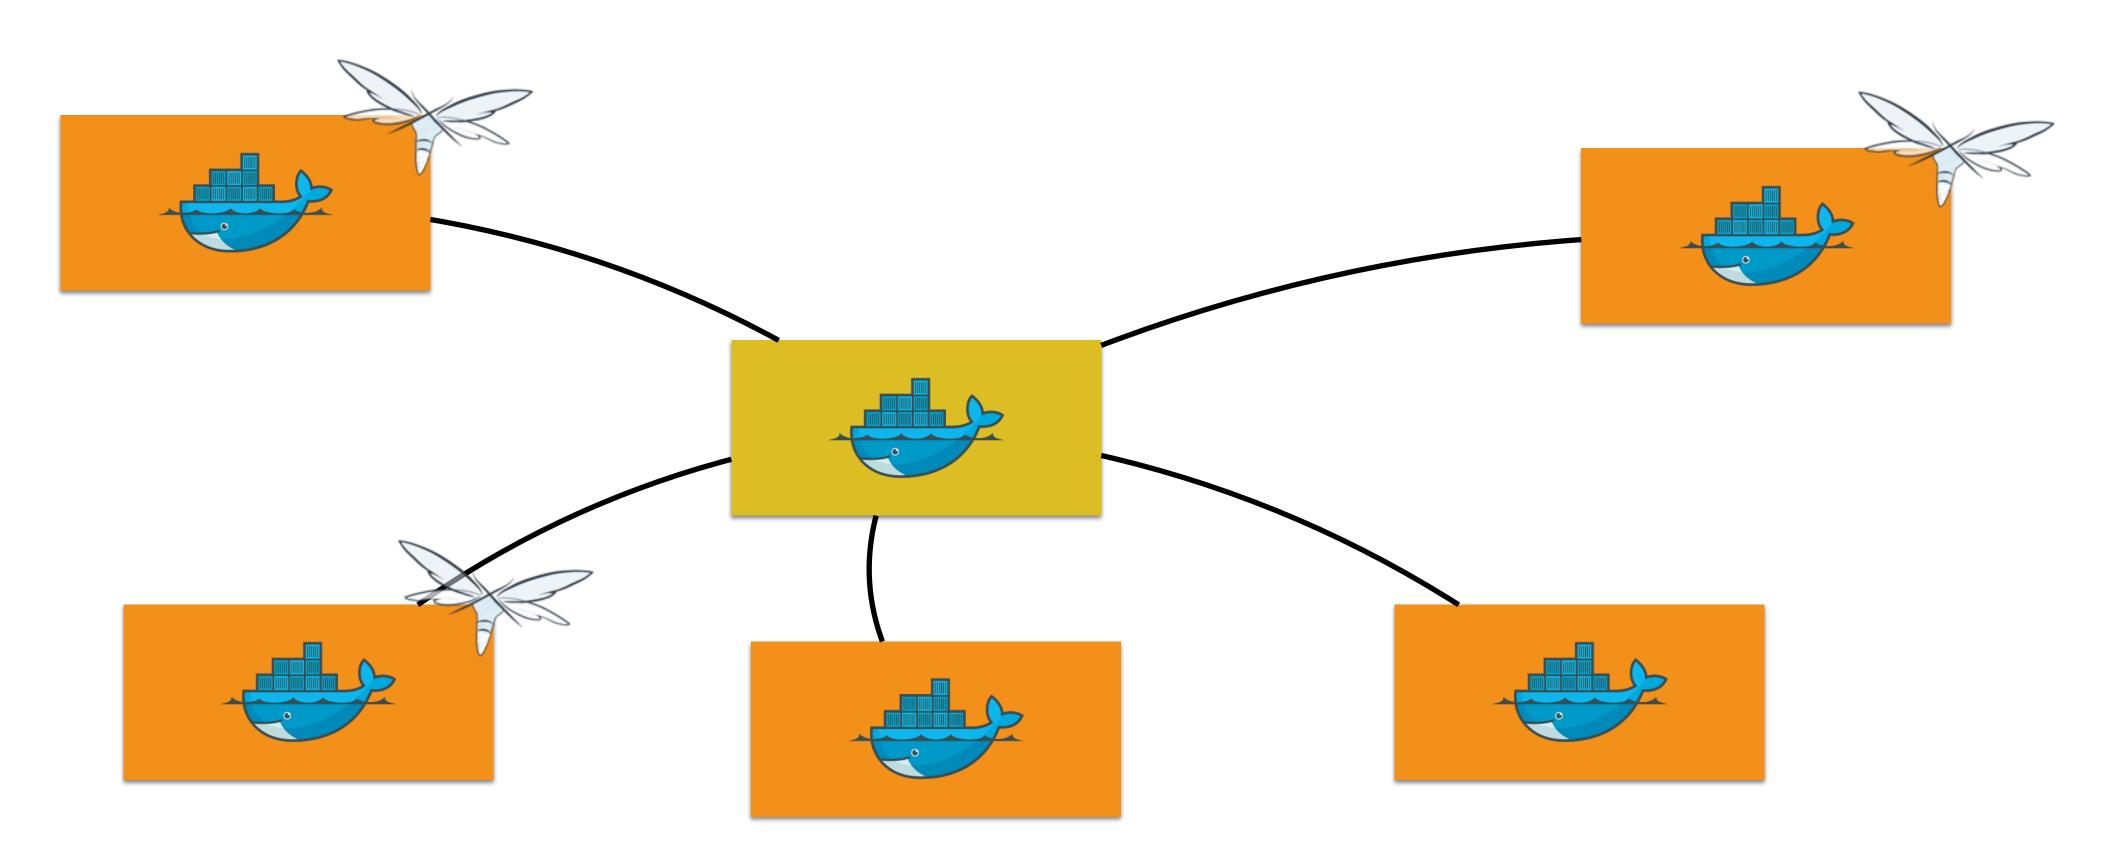

Swarm Mode: Container Failure

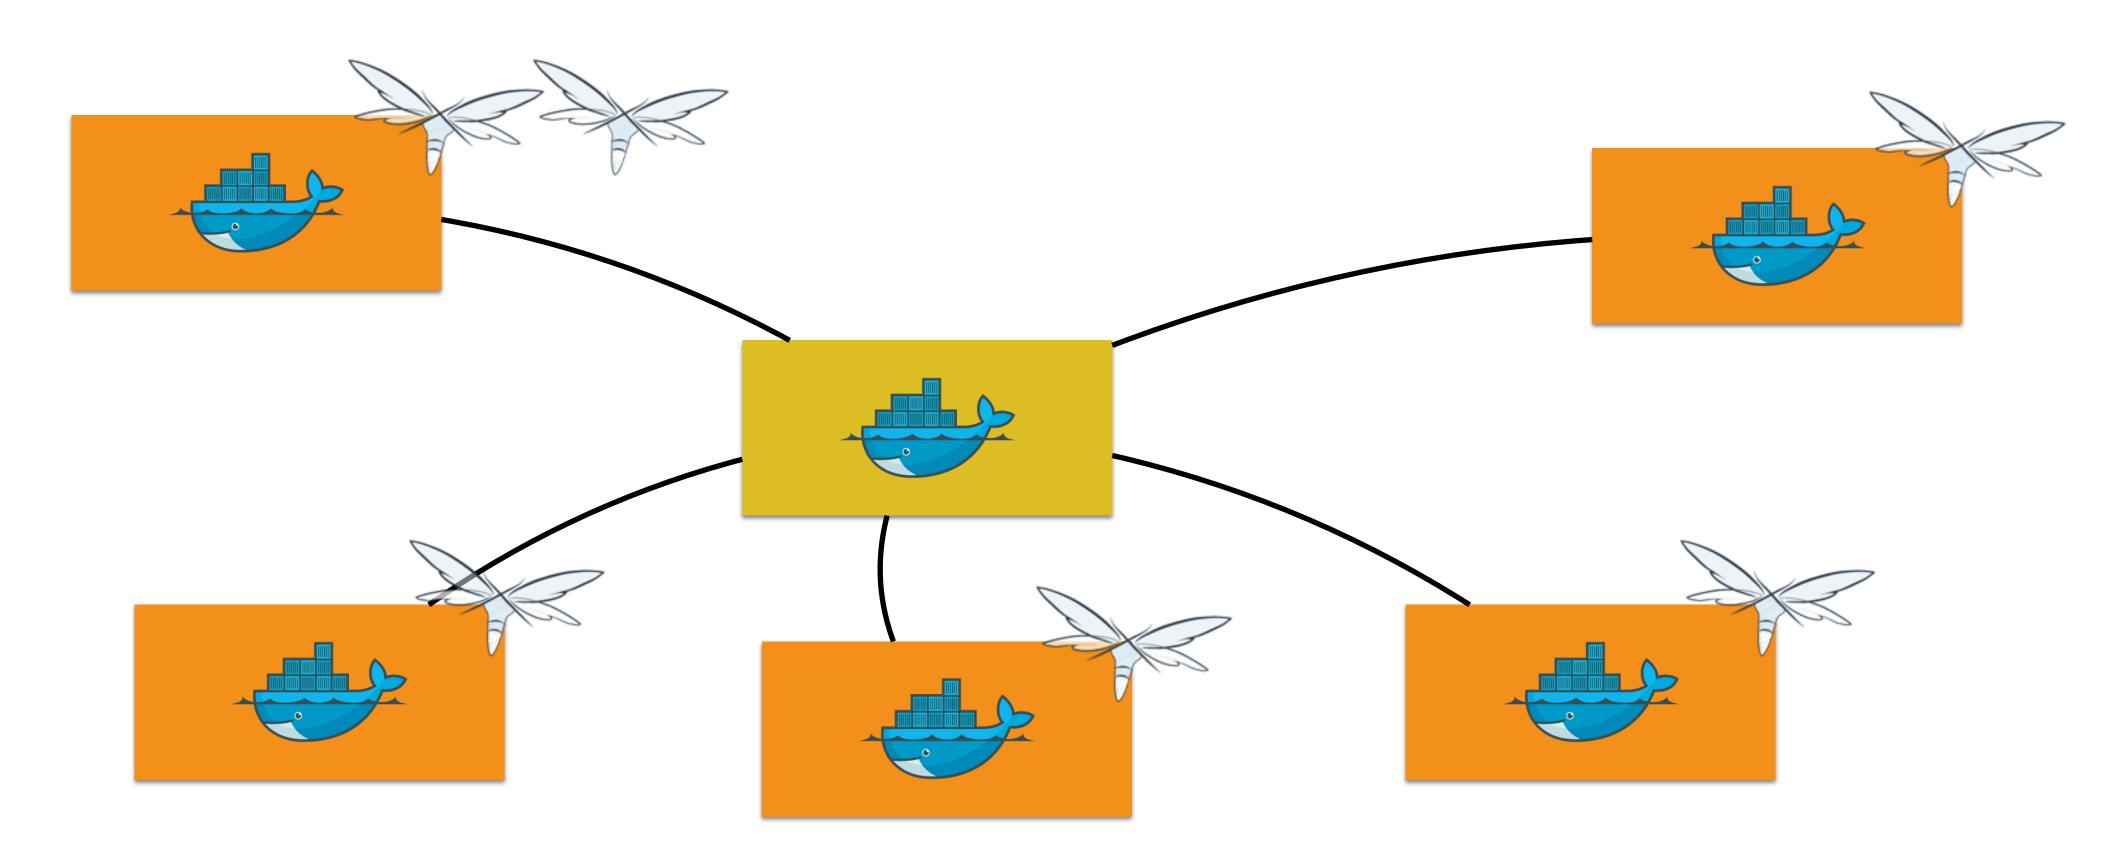

Swarm Mode: Desired!= Actual

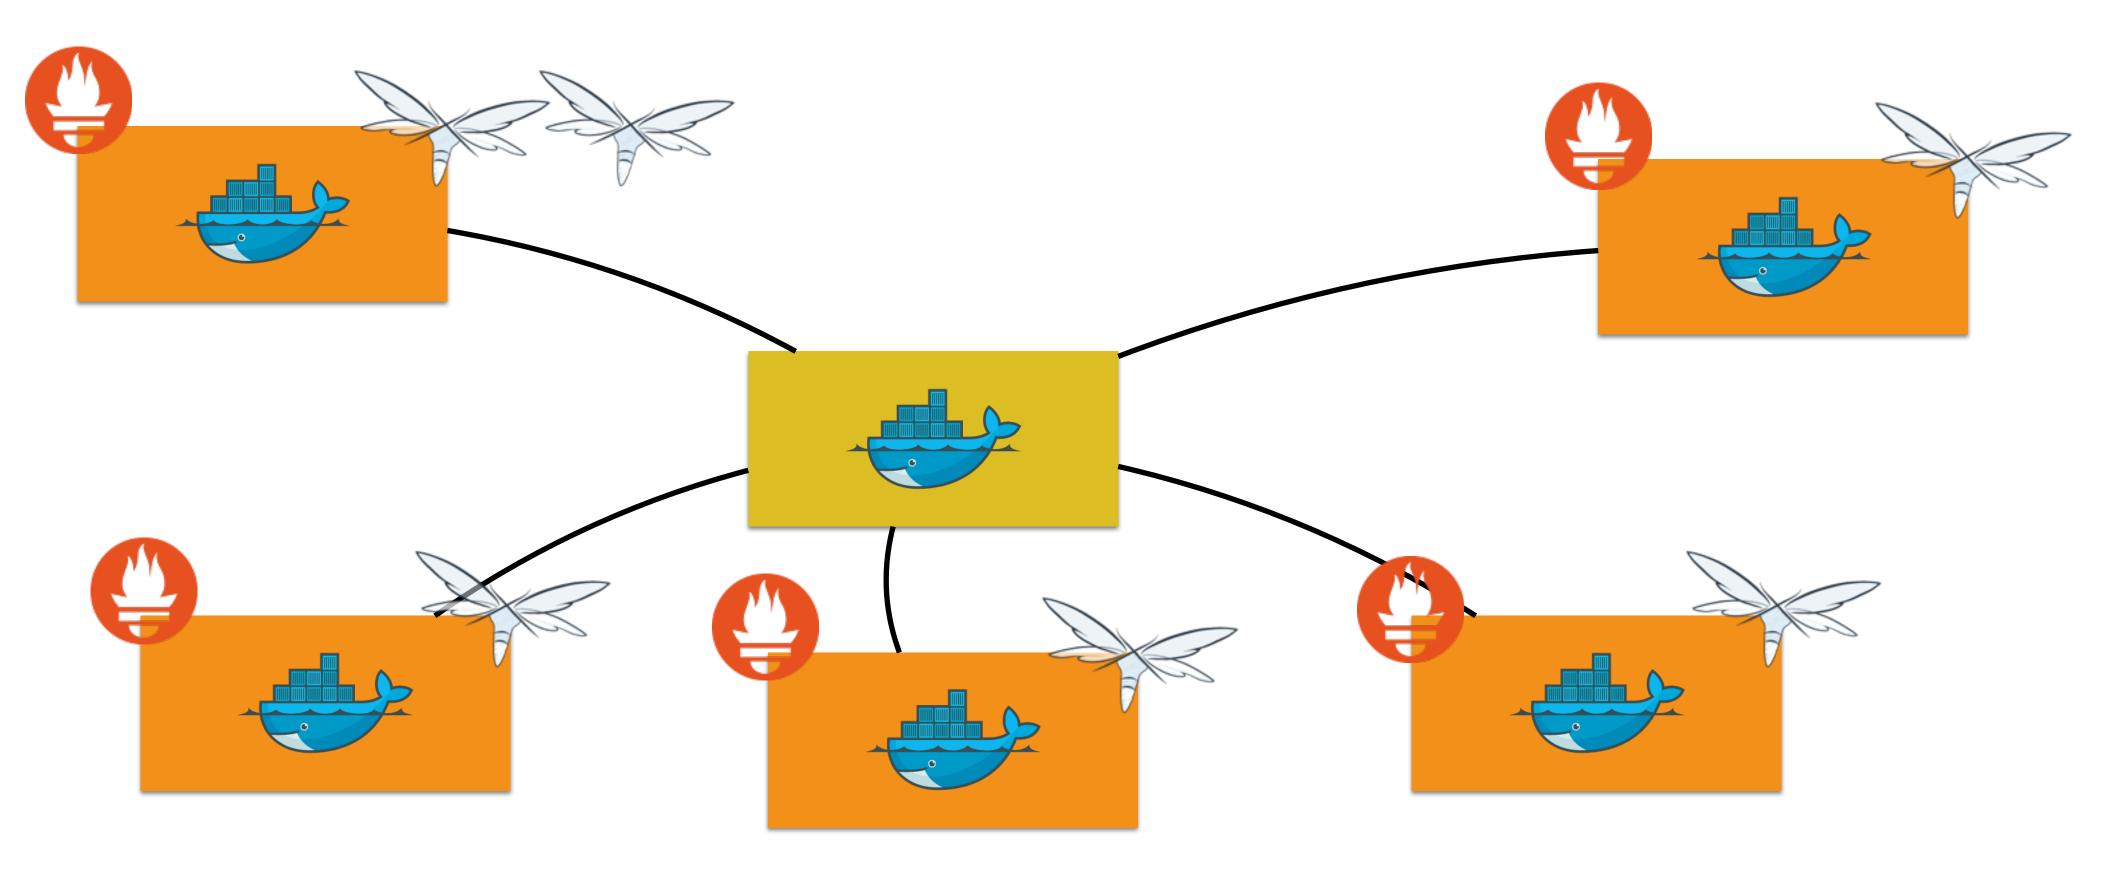

Swarm Mode: Reconcile

Swarm Mode: Scale

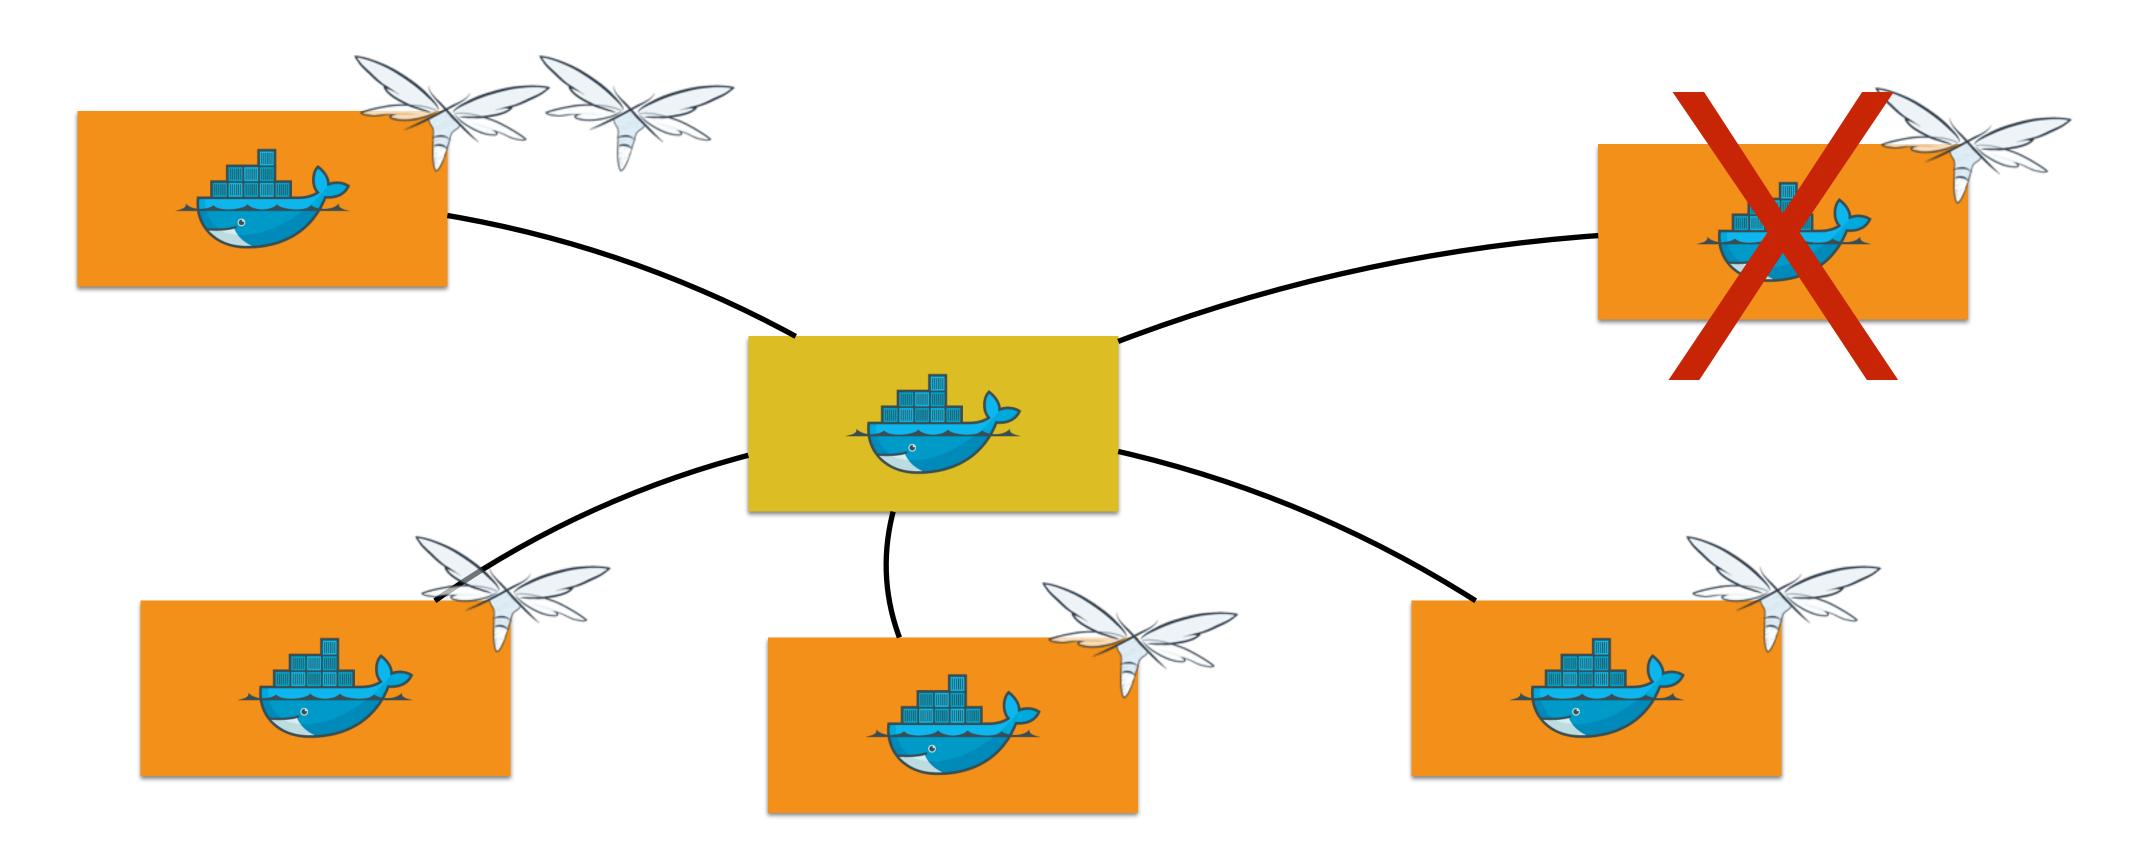

Swarm Mode: Global Service

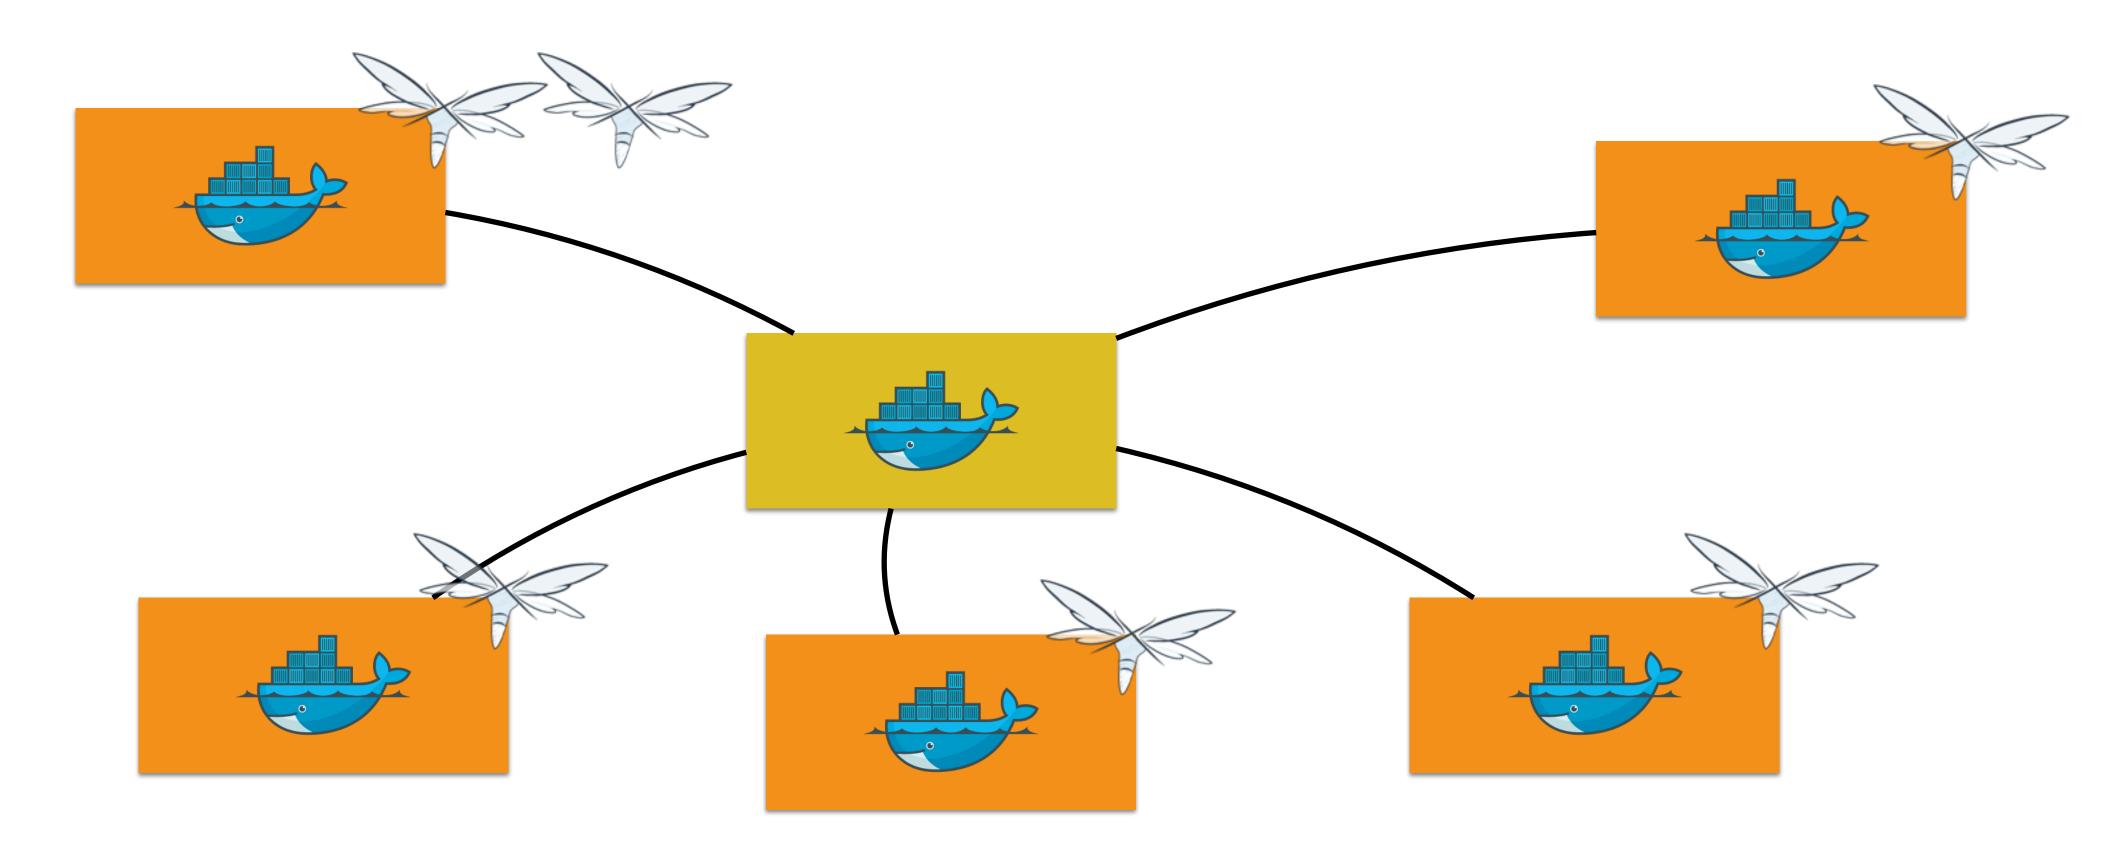

docker service create --mode=global --name=prom prom/prometheus

Swarm Mode: Pause Node

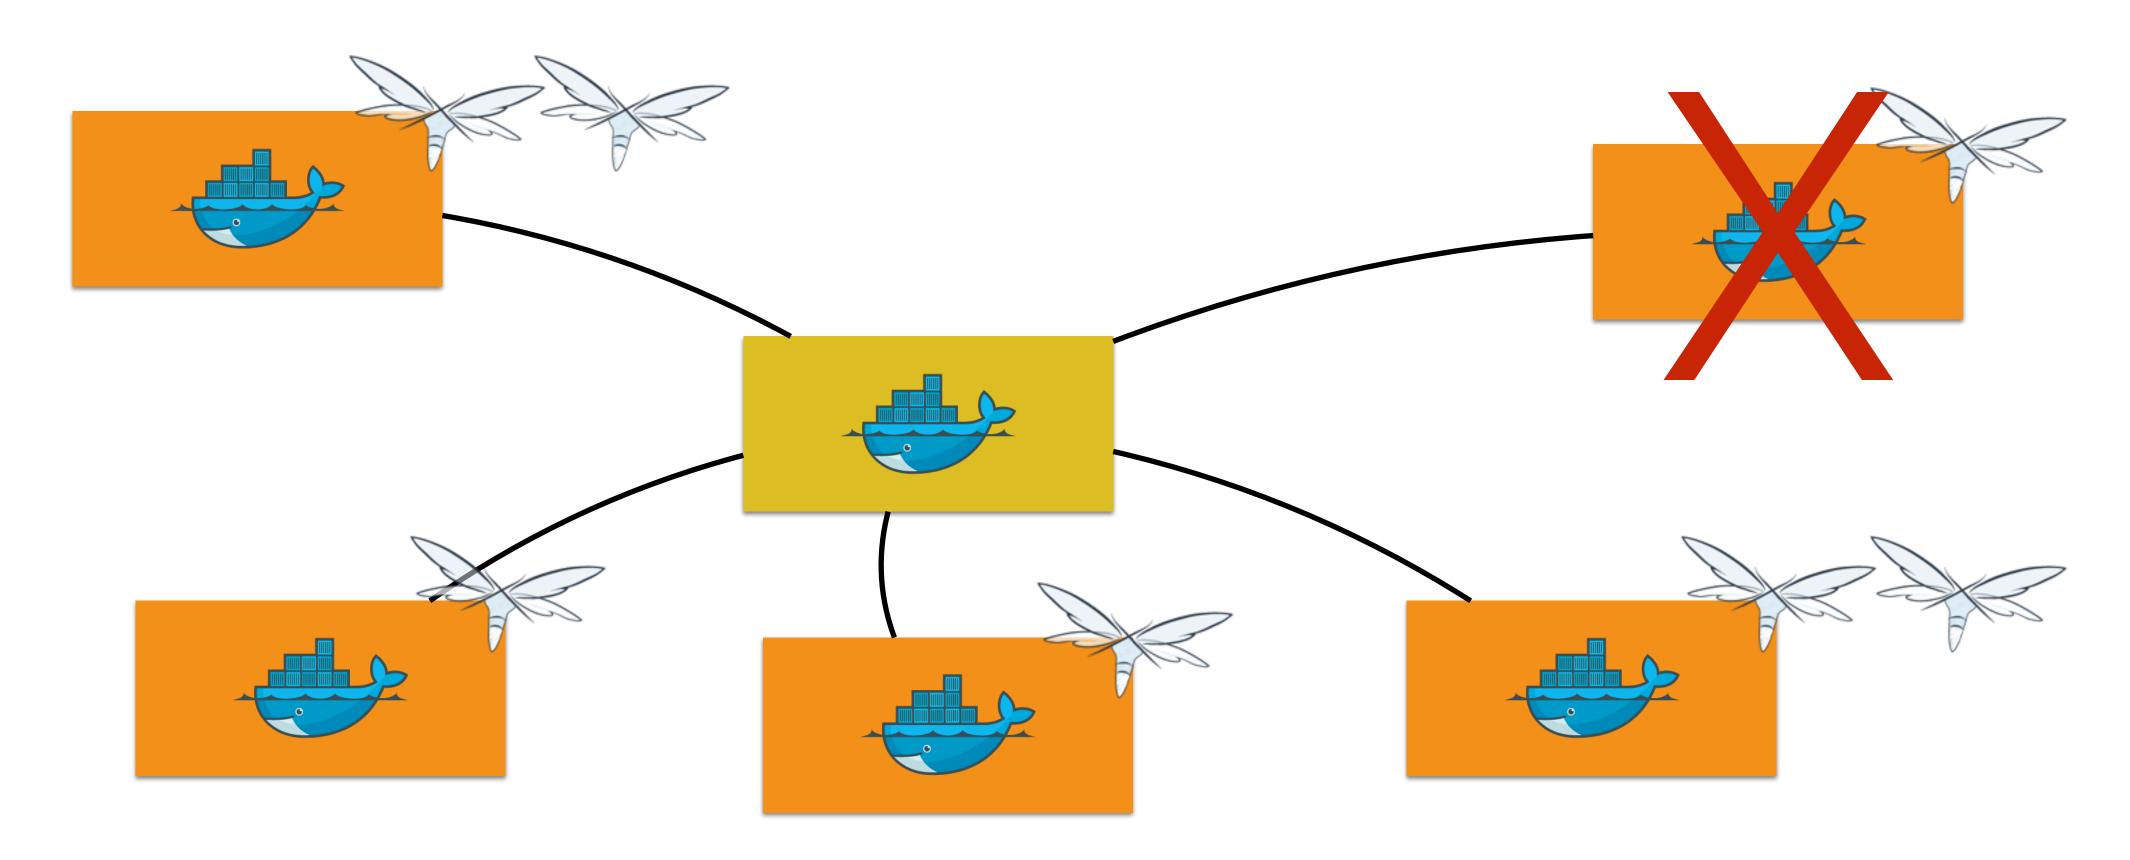

docker node update --availability pause <nodename>

Swarm Mode: Active Node

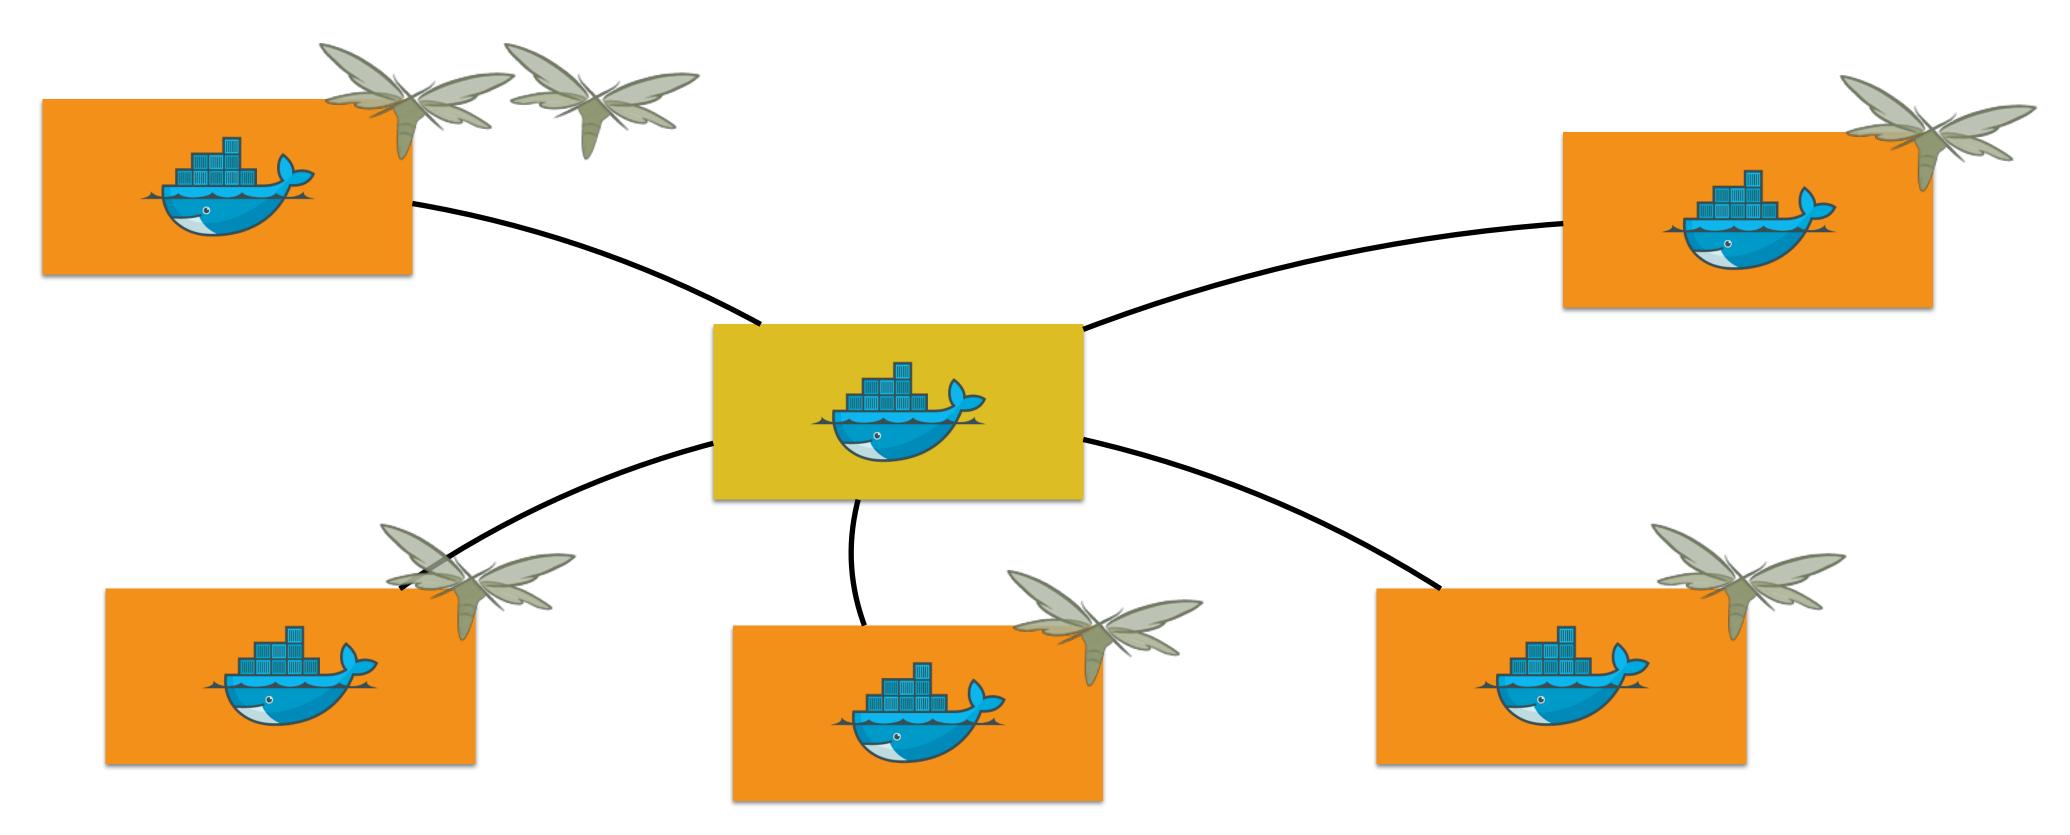

docker node update --availability active <nodename>

Swarm Mode: Drain Node

docker node update --availability drain <nodename>

Swarm Mode: Rolling Updates

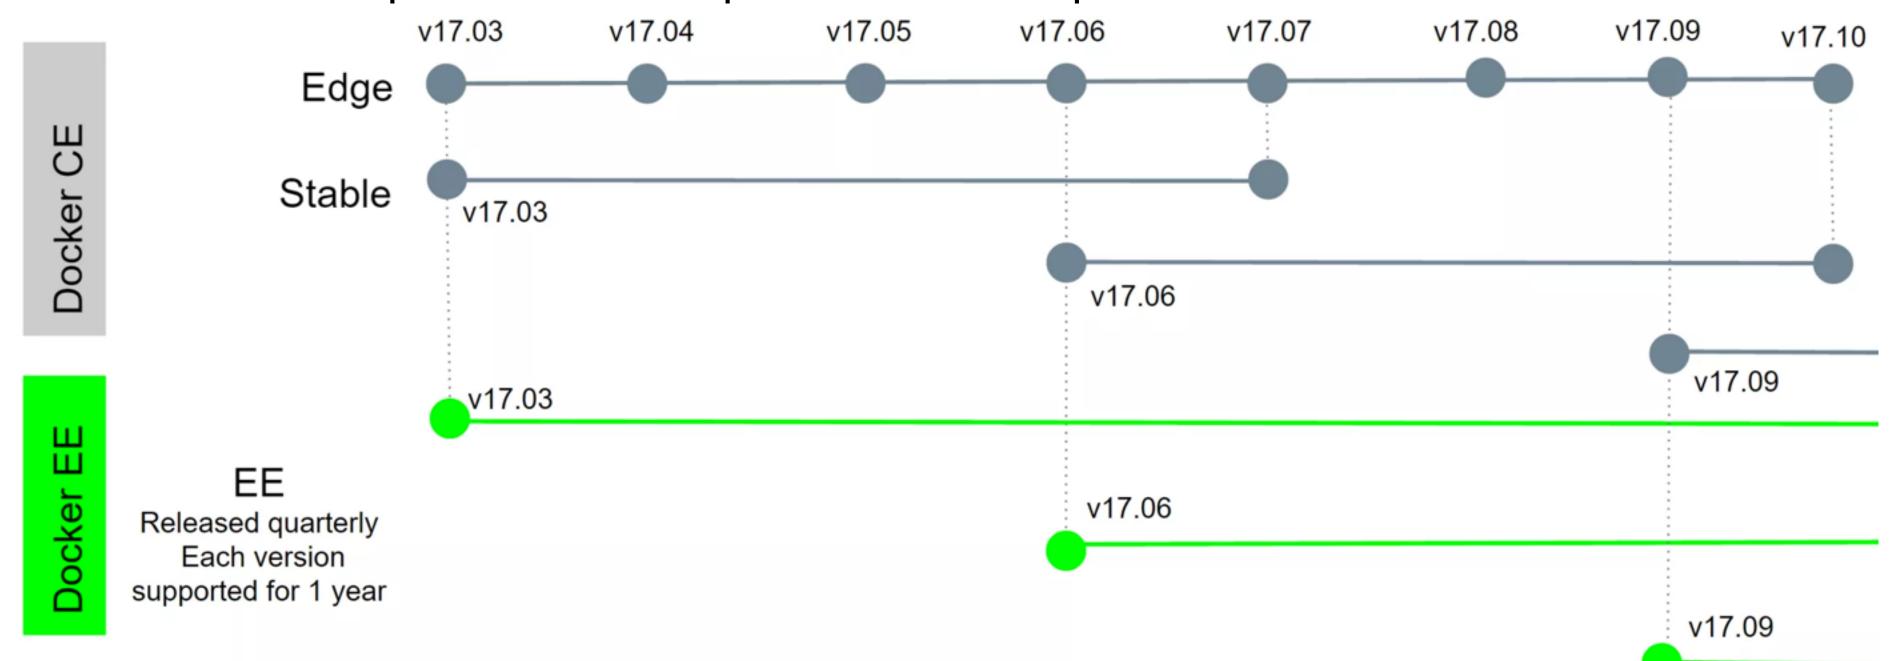

docker service update web --image wildfly:2 --update-parallelism 2 --update-delay 10s

Multi-Container Application on Multi-Host using Docker for AWS

Development: Docker

- Docker Community Edition
 - Docker for Mac/Windows/Linux
 - Monthly edge and quarterly stable releases
 - Native desktop or cloud provider experience

Docker for AWS/Azure

- Amazon Web Services
 - Amazon CloudFormation templates
 - Integrated with Autoscaling, ELB, and EBS
- Azure
 - Integrated with VM Scale Sets for autoscaling, Azure Load Balancer, Azure Storage
- docker.com/getdocker

Monitor Docker + Java Applications

Monitoring Docker Containers

- docker stats command
 - LogEntries

- **Iog**entries
- Service logs: docker service logs <service>
- Prometheus endpoint New in Docker 1.13
- Docker Remote API: /container/{container-name|cid}/stats
- Docker Universal Control Plane
- cAdvisor
 - Prometheus
 - InfluxDB

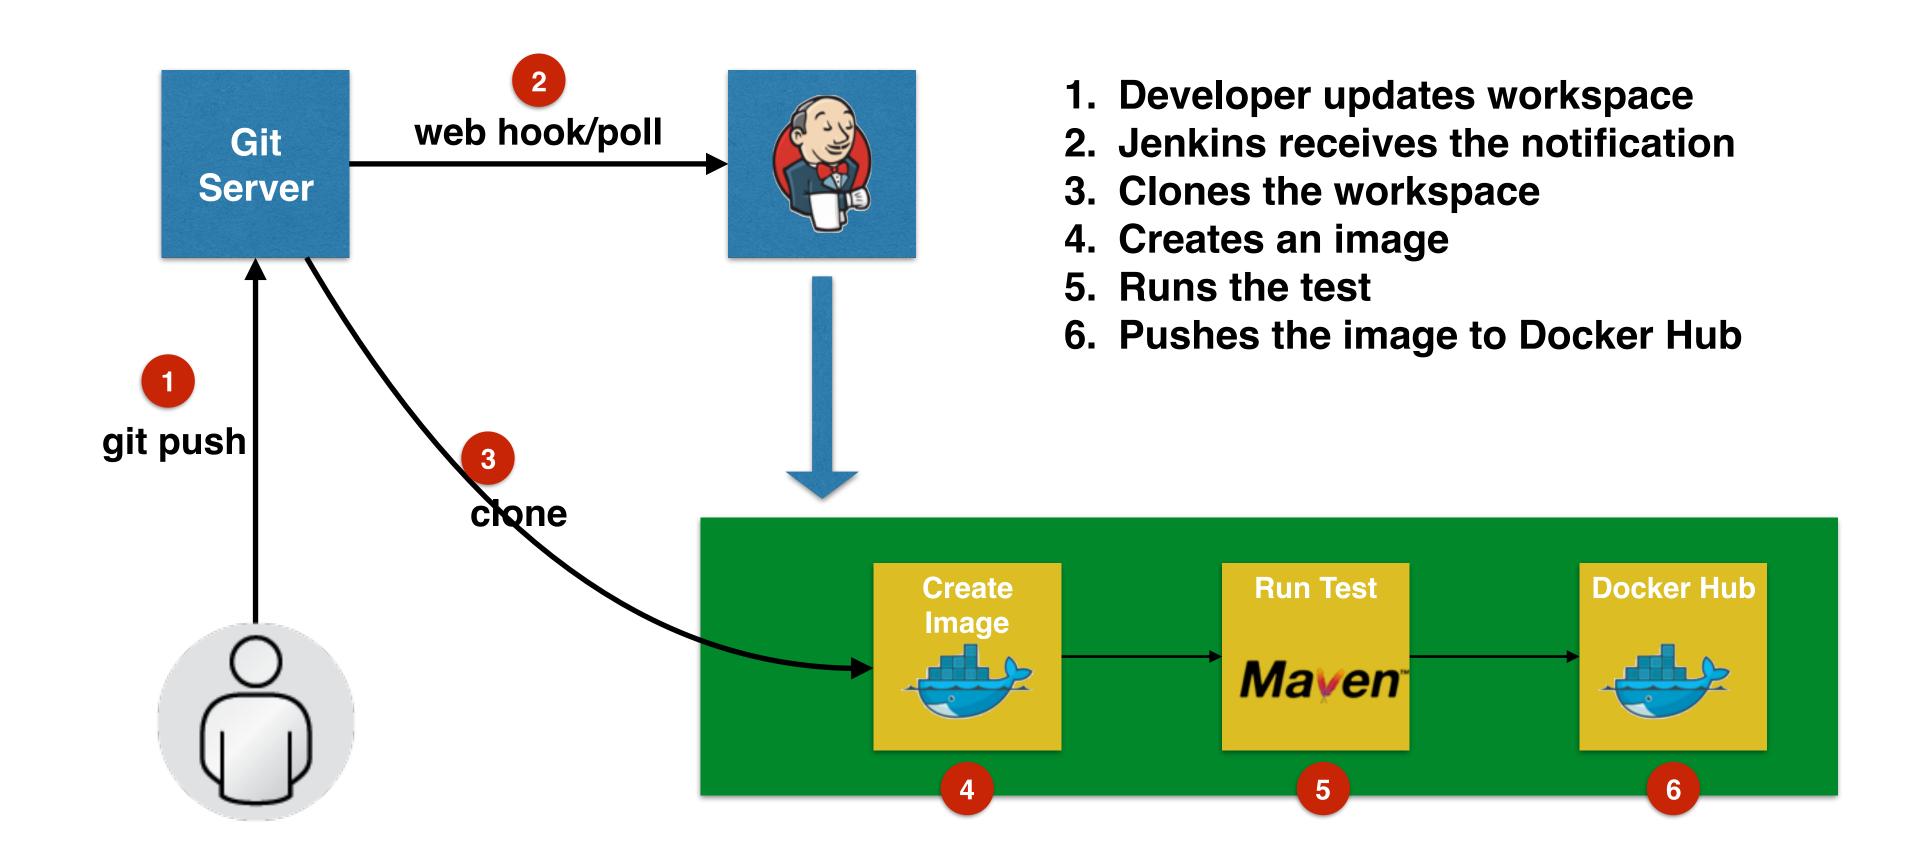

CI/CD with Docker + Jenkins
